

Mount Saver Glue Additive Technical Bulletin & Instructions

About: The Mount Medix Mount Saver Glue Additive is a formulation that can be added to any of the commonly used glues, pastes, epoxies and adhesives in the taxidermy industry. Why do this or why bother? Adding the glue additive to your adhesives is one important step in being able to create an insect /bug proof mount for your client. The adhesives will encapsulate the Mount Medix active creating a time-release mechanism for bug prevention.

Applications: Typically, this is a product that will only be used by the taxidermist during the preparation of the mounts. The Glue Additive is designed to mix into any of the common taxidermy adhesives without impacting the workability, set time and holding power of the adhesive.

For those taxidermists that use starch or dextrin-based adhesive, the addition of the glue additive will also prevent mould formation in the adhesive, so you will no longer have to add materials like Lysol to your adhesive. The glue additive along with the hide pre-soak will also prevent mould formation in the ears and tuck slots during drying for those who live and work in warm moist climates.

Available sizes and usage:

The Mount Medix Mount Saver Glue Additive is available in a 0,473 liter bottle. Add the Mount Saver Glue Additive at a rate of 1.5% to taxidermy adhesives. For example, use 150 ml (1,5 dl) Mount Saver Glue Additive to 10 kilo glue paste.

Shelf Life: Greater than 5 years
